

Chapter 4 - Integral Form for a Control Volume

Introduction to Fluid Mechanics

Section 4.3

Mechanical Engineering and Materials Science
University of Pittsburgh

Student Learning Objectives

Students should be able to:

- ▶ Apply the Conservation of Energy to systems

Chapter 4 - Integral
Form for a Control
Volume
Introduction to
Fluid Mechanics
Section 4.3

MEMS 0071

Learning Objectives

4.3 Conservation of
Energy

Conservation of Energy

- ▶ Separating mechanical losses from irreversibilities, our general energy equation, based upon prior assumptions, can be expressed as

$$\frac{P_1}{\rho g} + \frac{V_1^2}{2g} + z_1 + h_{pump} = \frac{P_2}{\rho g} + \frac{V_2^2}{2g} + z_2 + h_{turbine} + h_{loss}$$

h stands for head [m], and we have pump head, turbine head and head losses

- ▶ The COE is a modification to the Bernoulli equation - mass and momentum (energy) must be conserved

Conservation of Energy

- ▶ Defining η as our mechanical efficiency, $0 \leq \eta \leq 1$
- ▶ Pump head is expressed as

$$h_{pump} = \frac{W_{pump}}{g} = \frac{\dot{W}_{pump}}{\dot{m}g} = \frac{\eta \dot{W}_{pump}}{\dot{m}g}$$

- ▶ Note that if η is less than 1, the pump produces less head, i.e. it can not pump a fluid as high as a more efficient pump
- ▶ Turbine head is expressed as

$$h_{turbine} = \frac{W_{turbine}}{g} = \frac{\dot{W}_{turbine}}{\dot{m}g} = \frac{\dot{W}_{turbine}}{\eta \dot{m}g}$$

- ▶ Since $h_{turbine}$ is the extracted head from the fluid, η less than 1 indicates a greater head needs to be provided to produce the same work as a more efficient turbine

Conservation of Energy

Learning Objectives

4.3 Conservation of
Energy

- ▶ Lastly, head losses are defined as such

$$h_{loss} = \frac{\dot{E}_{mech,loss}}{\dot{m}g}$$

- ▶ This notation is not convenient for evaluation. In MEMS 1071, you will evaluate k-factors and frictional losses in piping systems to populate this term.

Example #1

- Consider the hydroelectric power plant shown below. If the discharge at the exit of the dam is $1.7 \text{ [m}^3/\text{s]}$, determine the power produced by the turbine assuming the frictional head loss through the penstock is 4 [m] . Also determine the power lost due to friction.

Example #1

4.3 Conservation of
Energy

Example #2

- Consider the pump system shown below. The pump supplies water to B at $2 \text{ [ft}^3/\text{s]}$. If the pipe is 6 in. diameter, determine the required horsepower to operate the pump, assuming the frictional head loss is 0.1 ft./ft.
